Studying Populations
This section describes how scientists study population density, size, and growth. The section also explains how factors such as food, space, and weather limit how large populations can become.

Use Target Reading Skills
Before you read, preview the red headings. In the graphic organizer below, ask a question for each heading. As you read, write the answers to your questions.

### Determining Population Size

13. Is the following sentence true or false? Population density is the number of individuals in a specific area. ________________

Limiting Factors

14. An environmental factor that causes a population to decrease is called a(n) _____________.

15. What are some limiting factors for populations?
________________________________________________________________________
________________________________________________________________________

16. The largest population that an area can support is called its _____________.

17. Is the following sentence true or false? Space is often a limiting factor for plants. ________________

18. What are some ways weather conditions can limit population growth?
________________________________________________________________________
Studying Populations

Key Concepts
- How do ecologists determine the size of a population?
- What causes populations to change in size?
- What factors limit population growth?

Some methods of determining the size of a population are direct and indirect observations, sampling, and mark-and-recapture studies. Direct observation involves counting the members of a population one by one. Indirect observation involves counting tracks, nests, or other signs rather than the organisms themselves.

Many times, it is not possible to count every member of a population because the population is too large or spread out or the members are hard to find. Instead, ecologists make an estimate of the population. An estimate is an approximation of a number, based on reasonable assumptions. One type of estimating involves counting the number of organisms in a small area (a sample), and then multiplying to find the number in a larger area.

Ecologists sometimes use a technique called mark and recapture. Some animals are first captured, marked, and released into the environment. Then another group is captured. The ecologists count the marked animals in this group. Using a mathematical formula, the ecologists can estimate the total population of those animals in the area.

Populations can change in size when new members enter the population or when members leave the population. The major way in which new individuals are added to a population is through the birth of new offspring. The birth rate of a population is the number of births in a population in a certain amount of time. The major way that individuals leave a population is by dying. The death rate is the number of deaths in a population in a certain amount of time. If the birth rate is greater than the death rate, the population will generally increase in size. If the death rate is greater than the birth rate, the population size will generally decrease. The size of a population can also change when individuals move into or out of the population. Immigration means moving into a population. Emigration means leaving a population. Graphs are useful to show changes in the size of a population over time.

One way to state the size of a population is in terms of population density—the number of individuals in a specific area. Population density is calculated by dividing the number of individuals in the population by the total area. The result tells how many individuals there are per unit area.

A limiting factor is an environmental factor that prevents a population from increasing. Some limiting factors for populations are food and water, space, and weather conditions. The largest population that an environment can support is called the carrying capacity.
Studying Populations

Understanding Main Ideas

Answer the following questions on a separate sheet of paper.

1. A vegetable garden is 12 meters long by 7 meters wide. In one square meter, you count two toads. Estimate the population of toads in the garden.

2. What are two ways that the size of a population can increase? What are two ways that the size of a population can decrease?

3. Over which time period(s) did the squirrel population decrease?

4. Over which time period(s) did the population increase?

5. In which year did the population reach its lowest point? What was the size of the population that year?

6. What causes a population to change in size?

7. Identify three limiting factors that can prevent a population from increasing. Explain how each factor limits a population’s size.

Building Vocabulary

On a separate sheet of paper, define each of these terms in your own words.

8. population density

9. carrying capacity

10. immigration
Unlimited Population Growth

Suppose that the organisms in a population have unlimited food, water, space, and other resources. Also suppose that the organisms are not killed by other organisms or by disease. With no limits on its growth, the population would increase at its highest possible rate.

Bacteria are microscopic, single-celled organisms that are often used to study population growth. Most bacteria reproduce by splitting in half. Under ideal conditions, bacteria can divide about every 30 minutes. In the first half hour, one bacterium produces two bacteria. In the second half hour, the two bacteria split to produce four bacteria. In the third half hour, the four bacteria split to produce eight bacteria. Every 30 minutes, the population doubles!

Use the table on the right to answer the following questions. Write your answers on a separate sheet of paper.

1. How many bacteria will there be in 10 hours? Fill in the blank rows to complete the table.

2. On a sheet of graph paper, graph the data in your completed table.

3. Describe the shape of the graph, and explain what it shows about the bacteria population.

4. Does the graph show what usually happens in real life? Why or why not?

<table>
<thead>
<tr>
<th>Time (hours)</th>

Counting Turtles

Problem
How can the mark-and-recapture method help ecologists monitor the size of a population?

Skills Focus
calculating, graphing, predicting

Materials
■ model paper turtle population
■ calculator
■ graph paper

Procedure
1. The data table shows the results from the first three years of a study to determine the number of snapping turtles in a pond.

2. Your teacher will give you a box representing the pond. Fifteen of the turtles have been marked, as shown in the data table for Year 4.

3. Capture a member of the population by randomly selecting one turtle. Set it aside.

4. Repeat Step 3 nine times. Record the total number of turtles you captured.

5. Examine each turtle to see whether it has a mark. Count the number of recaptured (marked) turtles. Record this number in the data table.

Data Table

<table>
<thead>
<tr>
<th>Year</th>
<th>Number Marked</th>
<th>Total Number Captured</th>
<th>Number Recaptured (with Marks)</th>
<th>Estimated Total Population</th>
</tr>
</thead>
<tbody>
<tr>

Counting Turtles (continued)

Analyze and Conclude
Write your answers in the spaces provided.

1. Calculating Use the equation below to estimate the turtle population for each year. The first year is done for you as a sample. Write your calculations on a separate sheet of paper. If your answer is a decimal, round it to the nearest whole number. Record the population for each year in the last column of the data table.

\[
\text{Total population} = \frac{\text{Number marked} \times \text{Total number captured}}{\text{Number recaptured (with marks)}}
\]

Sample (Year 1):

\[
32 \times \frac{28}{15} = 59.7 \text{ or } 60 \text{ turtles}
\]

2. Graphing On the next page, graph the estimated total populations for the four years. Mark years on the horizontal axis. Mark population size on the vertical axis.

3. Interpreting Data Describe how the turtle population has changed over the four years of the study. Suggest three possible causes for the changes.

________________________________________________________________________
________________________________________________________________________
________________________________________________________________________
________________________________________________________________________
________________________________________________________________________

4. Predicting Use your graph to predict what the turtle population will be in Year 5. Explain your prediction.

________________________________________________________________________
________________________________________________________________________
________________________________________________________________________
________________________________________________________________________

5. Communicating Write a paragraph that explains why the mark-and-recapture method is a useful tool for ecologists. When is this technique most useful for estimating population size?

________________________________________________________________________
________________________________________________________________________
________________________________________________________________________
________________________________________________________________________
